

Retirement planner

Questionnaire

Section 1: Household Profile

1. Primary client full name

Type: Short answer

2. Spouse / partner full name

Type: Short answer

3. Primary client date of birth

Type: Short answer

4. Spouse / partner date of birth

Type: Short answer

5. Current marital status

Type: Multiple choice

Options: Married filing jointly / Single / Head of household / Other

6. Current state of residence

Type: Short answer

7. Do you expect to move to another state in retirement?

Type: Multiple choice

Options: Yes / No / Not sure

8. If yes, where might you move and when?

Type: Paragraph

9. Number of children

Type: Short answer

10. List each child's name, current age, and expected years of financial dependence

Type: Paragraph

11. Are there any other dependents or family members you support financially?

Type: Multiple choice

Options: Yes / No

12. If yes, describe who they are and the expected annual support amount

Type: Paragraph

Section 2: Retirement Timing and Goals

13. What age would you like work to become optional for the primary client?

Type: Short answer

14. What age would you like work to become optional for the spouse / partner?

Type: Short answer

15. Which best describes your retirement plan?

Type: Multiple choice

Options: Full retirement / Semi-retirement / Continue part-time work / Never fully retire / Not sure

16. Desired annual after-tax spending in retirement, in today's dollars

Type: Short answer

17. Minimum annual after-tax spending needed to feel secure, in today's dollars

Type: Short answer

18. Which future spending changes do you expect?

Type: Checkboxes

Options: College expenses / Mortgage payoff / Second home / Travel increase / Travel decrease later / Support for parents / Weddings / Home purchase help for children / Major healthcare needs / None / Other

19. Describe any known future spending phases and when they begin

Type: Paragraph

20. What are the top three financial outcomes you want this plan to optimize for?

Type: Checkboxes

Options: Maximize retirement security / Lower lifetime taxes / Maximize Roth assets / Preserve ACA subsidies / Minimize Medicare IRMAA / Fund college / Leave inheritance / Support charitable giving / Flexibility to move abroad / Protect surviving spouse / Other

21. Anything else about your retirement goals that we should model?

Type: Paragraph

Section 3: Employment and Earned Income

22. Primary client current employment status

Type: Multiple choice

Options: Employed W-2 / Self-employed / Business owner / Retired / Other

23. Spouse / partner current employment status

Type: Multiple choice

Options: Employed W-2 / Self-employed / Business owner / Retired / Other

24. Expected last year of earned income for primary client

Type: Short answer

25. Expected last year of earned income for spouse / partner

Type: Short answer

26. Expected annual earned income for primary client over the next 5 years

Type: Paragraph

27. Expected annual earned income for spouse / partner over the next 5 years

Type: Paragraph

28. Do either of you expect bonuses, RSUs, stock options, deferred compensation, or business sale proceeds?

Type: Multiple choice

Options: Yes / No / Not sure

29. If yes, describe the type, rough timing, and expected amount

Type: Paragraph

Section 4: Current Tax Filing and Returns

30. Current federal tax filing status

Type: Multiple choice

Options: Married filing jointly / Married filing separately / Single / Head of household / Other

31. Approximate current marginal federal tax bracket

Type: Multiple choice

Options: 10% / 12% / 22% / 24% / 32% / 35% / 37% / Not sure

32. Approximate current marginal state tax rate

Type: Short answer

33. Do you usually itemize deductions?

Type: Multiple choice

Options: Yes / No / Not sure

34. Do you have capital loss carryforwards?

Type: Multiple choice

Options: Yes / No / Not sure

35. If yes, approximately how much?

Type: Short answer

36. Do you have charitable carryforwards, NOLs, or AMT credits?

Type: Multiple choice

Options: Yes / No / Not sure

37. If yes, describe

Type: Paragraph

38. Please upload or summarize your last 2–3 years of tax returns

Type: Paragraph

Section 5: Asset Inventory by Tax Bucket

39. Enter current balances by account type

Type: Paragraph

Requested fields:

- Taxable brokerage
- Cash / checking / savings / money market
- Traditional IRA / rollover IRA
- 401(k) / 403(b) / 457
- Roth IRA / Roth 401(k)
- HSA
- 529 plans
- Trust assets
- Rental real estate equity
- Business equity
- Other

40. Which taxable holdings have large unrealized gains or concentrated positions?

Type: Paragraph

41. For taxable holdings, do you know the cost basis by major position?

Type: Multiple choice

Options: Yes / No / Partially

42. Are there any legacy positions you do not want to sell?

Type: Multiple choice

Options: Yes / No

43. If yes, list them and explain why

Type: Paragraph

44. Do you hold any of the following?

Type: Checkboxes

Options: Employer stock / RSUs / Stock options / Private company stock / Partnership interests / REITs / Bond funds in taxable / High-dividend stocks / Municipal bonds / None / Other

Section 6: Income Sources in Retirement

45. Expected monthly Social Security benefit for primary client, in today's dollars

Type: Short answer

46. Expected monthly Social Security benefit for spouse / partner, in today's dollars

Type: Short answer

47. Planned Social Security claiming age for primary client

Type: Short answer

48. Planned Social Security claiming age for spouse / partner

Type: Short answer

49. Do you expect pension income?

Type: Multiple choice

Options: Yes / No

50. If yes, annual amount and start year

Type: Paragraph

51. Do you expect rental income, business income, trust income, or annuity income in retirement?

Type: Multiple choice

Options: Yes / No

52. If yes, describe source, expected annual amount, and timing

Type: Paragraph

Section 7: Healthcare Before Age 65

53. How do you expect to get health insurance before Medicare?

Type: Checkboxes

Options: Employer coverage / COBRA / ACA Marketplace / Private policy / Ministry / International coverage / Not sure / Other

54. If retiring before 65, what is your biggest concern about health coverage?

Type: Checkboxes

Options: Premium cost / ACA subsidy eligibility / Network / Specialists / Prescription coverage / Family coverage / Moving abroad / Not sure / Other

55. Would you consider structuring income to qualify for ACA subsidies?

Type: Multiple choice

Options: Yes / No / Maybe

56. Would you consider living abroad before 65 if that reduced healthcare costs materially?

Type: Multiple choice

Options: Yes / No / Maybe

57. If yes or maybe, which countries or regions would you consider?

Type: Paragraph

58. Do you or family members have ongoing medical needs that require U.S.-based coverage or specialist access?

Type: Multiple choice

Options: Yes / No

59. If yes, describe the practical constraints

Type: Paragraph

Section 8: Roth Contributions and Roth Conversions

60. Are you interested in regular Roth IRA contributions?

Type: Multiple choice

Options: Yes / No / Not sure

61. Are you interested in backdoor Roth contributions?

Type: Multiple choice

Options: Yes / No / Not sure

62. Are you interested in Roth conversions from pre-tax accounts?

Type: Multiple choice

Options: Yes / No / Not sure

63. When would you ideally begin Roth conversions?

Type: Short answer

64. What is the main goal of Roth conversions for you?

Type: Checkboxes

Options: Lower future RMDs / Lower lifetime taxes / Increase tax-free assets / Manage survivor tax risk / Reduce future IRMAA / Improve estate outcomes / Not sure / Other

65. Do you have any existing pre-tax IRA balances that would affect backdoor Roth planning?

Type: Multiple choice

Options: Yes / No / Not sure

66. Are you willing to use taxable assets to pay tax on Roth conversions?

Type: Multiple choice

Options: Yes / No / Maybe

Section 9: Spending, Cash Flow, and Withdrawal Preferences

67. Which accounts would you prefer to spend from first in retirement?

Type: Checkboxes

Options: Cash / Taxable brokerage / Traditional IRA / 401(k) / Roth accounts / HSA / No preference / Not sure

68. How many years of spending do you want held in cash or near-cash?

Type: Short answer

69. Would you reduce discretionary spending if markets fell 20%–30% early in retirement?

Type: Multiple choice

Options: Yes / No / Maybe

70. Are there large one-time expenses we should model?

Type: Multiple choice

Options: Yes / No

71. If yes, list the expense, expected year, and estimated amount

Type: Paragraph

Section 10: College and Family Funding

72. Do you plan to fully fund, partially fund, or not fund college costs?

Type: Multiple choice

Options: Fully fund / Partially fund / Not fund / Not sure

73. Expected annual college cost per child, in today's dollars

Type: Short answer

74. Expected number of years of support per child

Type: Short answer

75. Do you plan to help children with graduate school, weddings, or home down payments?

Type: Multiple choice

Options: Yes / No / Maybe

76. If yes, describe the expected support and rough timing

Type: Paragraph

Section 11: Charitable Giving and Gifting

77. Do you currently give to charity annually?

Type: Multiple choice

Options: Yes / No

78. Approximate annual charitable giving amount

Type: Short answer

79. Would you consider donating appreciated securities instead of cash?

Type: Multiple choice

Options: Yes / No / Maybe

80. Would you consider using a donor advised fund?

Type: Multiple choice

Options: Yes / No / Maybe

81. Do you plan to make lifetime gifts to heirs?

Type: Multiple choice

Options: Yes / No / Maybe

82. If yes or maybe, describe goals and rough scale

Type: Paragraph

Section 12: Estate Planning and Legal Structure

83. Do you have an up-to-date will?

Type: Multiple choice

Options: Yes / No / Not sure

84. Do you have a revocable trust?

Type: Multiple choice

Options: Yes / No / Not sure

85. Do you have any irrevocable trusts or advanced estate structures?

Type: Multiple choice

Options: Yes / No / Not sure

86. Are beneficiary designations current on retirement accounts and insurance policies?

Type: Multiple choice

Options: Yes / No / Not sure

87. Do you want estate planning included in the scenario modeling?

Type: Multiple choice

Options: Yes / No / Maybe

Section 13: Risk, Flexibility, and Scenario Preferences

88. Which scenarios do you want modeled?

Type: Checkboxes

Options: Base case / Early retirement / Delayed retirement / Lower return scenario / Higher inflation scenario / One spouse dies early / Move to lower-tax state / Move abroad / Max Roth conversion / Preserve ACA subsidies / Maximize legacy / Other

89. What is the biggest financial risk you want us to protect against?

Type: Paragraph

90. What is the biggest opportunity you want us to pursue?

Type: Paragraph

91. Anything else that would materially affect your plan?

Type: Paragraph

Optional Intake Table Format for Faster Modeling

If you prefer spreadsheet intake instead of long-form answers, provide a table with these columns:

- Category
- Subcategory
- Owner
- Current Amount
- Annual Amount
- Start Year
- End Year
- Tax Treatment
- Notes

Suggested categories:

- Household
- Assets
- Liabilities
- Earned Income
- Passive Income
- Social Security
- Pension
- Healthcare
- College
- Spending
- Charitable Giving
- Estate Planning
- Scenario Preferences

PDF + media presentation builder

Project Summary: AI Presentation Automation System

1. What this project is

This project is an attempt to build a reusable **AI-powered presentation automation system** that can take business source content—PDFs, spreadsheets, images, videos, notes, or outlines—and turn it into a polished presentation in multiple formats.

The original goal was:

Users upload content, choose a design style, and receive an interactive, stylish HTML presentation, with the option to export to PowerPoint or Google Slides-compatible PPTX.

The system evolved from a simple “prompt that creates HTML” into a more structured automation framework with:

- a canonical content-planning methodology,
 - reusable design/style presets,
 - layout safety rules,
 - a WEX-branded presentation skin,
 - export rules for PowerPoint,
 - and experimental implementations across Custom GPTs, Gemini Gems, and Claude Skills.
-

2. What I built

I built several versions of a presentation automation assistant.

A. Custom GPT version

The Custom GPT was designed to:

- accept uploaded PDFs, spreadsheets, images, and videos,
- analyze the source content,
- create an interactive HTML presentation,
- offer design style options,

- support a WEX-branded design style,
- optionally export to PowerPoint / Google Slides-compatible PPTX.

The Custom GPT relied on:

- GPT Instructions,
- uploaded Knowledge files,
- HTML/CSS/JS templates,
- style presets,
- WEX template rules,
- PowerPoint export guidance.

This approach is similar to how OpenAI custom GPTs are commonly used: as specialized chatbot configurations that combine instructions, knowledge files, file upload behavior, and tool capabilities. Custom GPTs are a broad customization platform, and security researchers have also noted that custom GPTs can expose instructions or files if sensitive material is embedded without care, which is relevant for this project because the WEX template and internal logic should be treated as reusable but non-sensitive whenever possible.

B. Gemini Gem version

I then tried to reproduce the same workflow as a **Gemini Gem**.

The Gem used:

- Gem instructions,
- uploaded Knowledge files,
- `STYLE_PRESETS_GEM.md`,
- `HTML_LAYOUT_PATTERNS.md`,
- `WEX_TEMPLATE.md`.

The Gem worked partially, but it had reliability issues:

- WEX and Executive Premium sometimes generated different story flows.
- WEX often produced smaller fonts and more condensed layouts.
- Some outputs had blank slides or title-only slides.
- Some layouts showed awkward wrapping or excessive unused space.
- HTML-to-PPT export created flawed WEX cover slides.

This exposed an important lesson: Gemini Gems are useful as reusable custom assistants, but they may interpret uploaded reference files more loosely than expected. Google's Gems are customizable Gemini assistants that can be configured for specific tasks and grounded with uploaded files, and they have been integrated into Workspace apps like Docs, Sheets, Slides, Drive, and Gmail for Workspace users.

C. Claude Skill version

I also explored a Claude Skill implementation.

The Claude Skill package was designed to include:

```
None
wex-presentation-builder/
  SKILL.md
  references/
    style-presets.md
    html-layout-patterns.md
    wex-template.md
    ppt-export-rules.md
  scripts/
    validate_html_deck.py
    create_wex_pptx.py
  agents/
    openai.yaml
```

The Claude Skill approach is more like a packaged workflow than a prompt. Claude Skills are described as folders containing custom instructions, scripts, and resources that Claude can use for specialized professional tasks. They are closer to my desired automation model because my project is not just “one prompt”; it is a workflow with templates, validation, export logic, and brand rules.

I ran into a product-access issue: my Claude UI showed **Browse skills** but not an obvious **Upload skill** option. This suggests my account or workspace may not currently expose custom skill upload, or that it may require code execution/file creation or admin enablement.

3. Methodology / framework

The core methodology you created is:

```
None
Source content → Canonical content plan → Style selection → HTML
deck → Optional PPTX export
```

This is the most important architectural idea in the whole project.

Step 1: Source intake

The system accepts:

- PDFs,
- spreadsheets,
- images,
- videos,
- notes,
- outlines.

The source file is treated as the factual basis. The AI should not simply copy pages. It should analyze the content and transform it into a presentation narrative.

Step 2: Canonical content plan

Before design, the system creates one content plan.

The content plan defines:

- slide count,
- slide order,
- slide titles,
- key messages,
- KPIs,
- tables/charts,
- recommendations,
- source-derived facts,
- visible body content.

This became the central control mechanism.

Step 3: Content lock

Once the canonical content plan is created, design styles are treated as **visual skins only**.

This rule was added because early versions changed the story flow, KPI choices, and slide count when a different style was selected.

The final principle is:

Design can change the look. Design cannot change the business story.

Step 4: Style selection

The system offers multiple styles:

1. **WEX Branded**
2. **Executive Premium**
3. **Data Command Center**
4. **Editorial Strategy**
5. **Product Demo**

The WEX style became the most important special case.

Step 5: HTML generation

The system creates a browser-ready interactive HTML deck with:

- inline CSS,
- inline JavaScript,
- hover effects,
- keyboard navigation,
- scroll/wheel navigation,
- slide snapping,
- media support,
- responsive viewport-safe layouts.

Step 6: Export

After HTML generation, the user can optionally request:

- PowerPoint **.pptx**,
- Google Slides-compatible **.pptx**,
- PDF.

The key export insight is:

PowerPoint should be rebuilt from the canonical content plan, not directly converted from raw HTML.

This matters because HTML hover effects, scroll behavior, JavaScript, CSS pseudo-elements, and responsive layout do not map cleanly to PowerPoint.

4. Tools and skills used

Core tools

Custom GPT

Used for the main prototype. Strengths:

- easy to configure,
- supports uploaded Knowledge files,
- can generate files when code/data tools are enabled,
- good for iterative design and prompt refinement.

Weaknesses:

- instruction length limits,
- Knowledge retrieval is not always deterministic,
- complex multi-file behavior can drift,
- HTML-to-PPT conversion needs explicit rules.

Gemini Gem

Used to test whether the same automation can work in Gemini.

Strengths:

- simple custom assistant concept,
- can use uploaded files,
- integrates with the Google ecosystem,
- potentially useful for Workspace users.

Weaknesses:

- less reliable for complex multi-file production rules,
- may interpret reference files as optional inspiration,
- sometimes changes content when only design should change,
- may produce blank slides unless strongly instructed.

Claude Skill

Explored as a stronger fit for the workflow.

Strengths:

- skill packages can include instructions, resources, and scripts,

- better conceptual match for repeatable workflows,
- suitable for professional document automation,
- can include validation and PPTX creation scripts.

Weaknesses:

- UI access/upload may depend on account or workspace settings,
 - custom skill upload was not visible in my current Claude UI,
 - security/trust matters because Skills can include executable scripts. Security researchers have warned that AI assistant plug-in or skill ecosystems can create new attack surfaces if users install untrusted automation bundles.
-

5. Key design concepts

A. Canonical content plan

This is the “source of truth” for the presentation.

It prevents the AI from regenerating different narratives every time a style changes.

Non-negotiable fields:

None

slide count
slide order
slide titles
key messages
KPIs
tables/charts
recommendations
facts
visible body content

B. Style as skin

A style can change:

- colors,
- fonts,

- backgrounds,
- logo placement,
- card treatments,
- accent lines,
- hover effects,
- media framing.

A style cannot change:

- story flow,
- KPIs,
- business interpretation,
- recommendations,
- slide count,
- source facts.

C. WEX Branded = Executive Premium layout + WEX skin

This became the clearest WEX rule.

Originally, WEX was treated like its own layout system. That caused smaller fonts, condensed cards, and unused space.

The corrected model is:

None

Executive Premium layout
 + WEX colors
 + WEX cover
 + WEX logo
 + WEX light-blue interiors
 + WEX accents

D. Layout safety

The project introduced layout safety rules to prevent common AI-generated design failures:

- no paragraph-length text in narrow side rails,
- no one-word-per-line wrapping,
- no oversized blank spaces,
- no title-only slides,
- no empty cards,

- no empty tables,
- no internal scrolling,
- no seeing two slides at once,
- every slide must fit one viewport.

E. Export-aware design

HTML and PPT are not the same medium.

The project now separates:

None

HTML design rules

PPT export rules

For example, WEX HTML cover can use CSS gradients and pseudo-elements, while WEX PPT cover needs to be rebuilt with PowerPoint-native shapes.

6. Changeable vs. non-changeable parts

Non-changeable

These should stay fixed because they define the system's integrity.

1. Content lock

Design style must not change the story.

2. Canonical content plan

Every output format should be based on the same plan.

3. WEX inheritance rule

WEX Branded must use Executive Premium layout with WEX skin.

4. No blank slides

Every content slide must render visible content.

5. Layout safety

No unreadable wrapping, no clipped content, no slide overflow.

6. PPT cover rule for WEX

For WEX PPT export:

None

slide 1 = branded cover only

no KPI cards

no tables

no summary cards

Changeable

These are safe to customize.

1. Style options

I can add more styles later, such as:

- Investor Pitch,
- Sales Enablement,
- Minimalist Board Deck,
- Product Launch,
- Campaign Readout.

2. WEX visual skin

I can refine:

- exact colors,
- logo asset,
- title background,
- diagonal streaks,
- footer copy,
- card border style.

3. Slide patterns

I can add:

- timeline slides,
- roadmap slides,
- waterfall charts,
- funnel diagrams,
- executive summary pages,
- appendix pages.

4. Export destinations

I can expand from HTML/PPTX to:

- PDF,
- Google Slides via import,
- static image deck,
- web-hosted version,
- shareable microsite.

5. Validation scripts

I can add automated checks for:

- blank slides,
 - missing logos,
 - font size too small,
 - content overflow,
 - missing citations,
 - bad table wrapping.
-

7. What the system is capable of

The system can eventually support:

Source-to-deck generation

It can turn PDFs, spreadsheets, notes, and media into a structured deck.

Executive storytelling

It can convert raw reports into:

- executive answer,

- key findings,
- evidence,
- implications,
- recommendations.

Data-driven presentations

It can identify and present:

- KPIs,
- trends,
- outliers,
- tables,
- scorecards,
- brand comparisons.

Branded presentation generation

It can apply WEX-specific styling:

- WEX cover,
- WEX colors,
- WEX logo,
- WEX interior backgrounds,
- WEX footer,
- WEX accent rules.

Interactive HTML presentations

It can generate browser presentations with:

- hover states,
- slide navigation,
- scroll snapping,
- media embeds,
- responsive layout.

PowerPoint export

It can create PPTX versions by rebuilding from the canonical plan.

Google Slides workflow

It can create a PowerPoint file that can be imported into Google Slides.

8. Current limitations

A. AI layout reliability

The AI sometimes chooses bad layouts unless rules are very explicit. Examples you saw:

- narrow text columns,
- font too small,
- too much unused space,
- title-only slides,
- blank content sections.

B. Style drift

Without content lock, different styles can change the story. This is why the canonical content plan is essential.

C. HTML-to-PPT mismatch

HTML interactivity does not transfer into PowerPoint.

Lost in PPT export:

- hover effects,
- JavaScript,
- scroll navigation,
- nav dots,
- CSS pseudo-elements,
- responsive behavior.

D. Brand fidelity

WEX design can be approximated, but exact brand fidelity requires official brand assets, logo files, fonts, and brand guidelines.

E. Platform differences

The same files behave differently across Custom GPT, Gemini Gem, and Claude Skill because each platform handles instructions, files, and tool execution differently.

F. Security and privacy

Custom assistants and skills can expose instructions or uploaded knowledge if not designed carefully. Public reporting and academic work have found prompt/instruction leakage and other vulnerabilities in custom GPT-style systems, and similar risks exist whenever reusable AI tools contain sensitive instructions, files, or executable code.

9. Opportunities

Short-term opportunities

1. Create a single stable GPT version

Focus on one reliable implementation first, likely the Custom GPT.

2. Separate the workflow into modules

Use clean modules:

```
None
content planning
style selection
HTML generation
validation
PPT export
```

3. Add validation before output

Before returning a deck, check:

- every slide has content,
- no slide overflows,
- logo appears correctly,
- WEX cover is correct,
- PPT slide 1 is not a KPI slide.

4. Create a WEX brand asset pack

Add:

- official logo,
- exact color palette,
- typography guidance,
- approved cover examples,
- approved footer language.

5. Create benchmark prompts

Use a small set of repeatable test files and prompts to evaluate every version.

Medium-term opportunities

1. Build a proper content-plan JSON schema

Instead of letting the AI improvise, require a structured object:

```
None
{
  "deck_title": "...",
  "style": "...",
  "slides": [
    {
      "slide_type": "executive_answer",
      "title": "...",
      "body": "...",
      "cards": [...]
    }
  ]
}
```

This would make HTML and PPT generation much more reliable.

2. Generate PPTX from content JSON

Rather than asking the model to “make a PPT,” use a deterministic script that reads the JSON and creates slides.

3. Add a layout validator

A script can flag:

- empty slides,
- tiny font sizes,
- missing WEX logo,
- too many words on a slide,
- tables that are too wide,
- content outside slide bounds.

4. Add a brand validator

For WEX slides, check:

- WEX logo lower-right,
- WEX title background,
- WEX interior background,
- no KPI cards on PPT cover,
- red/blue accents present.

Long-term opportunities

1. Productize this as an internal presentation assistant

This could become a reusable internal tool for monthly business reviews, marketing performance decks, campaign readouts, and operating reviews.

2. Expand to multiple brands/templates

WEX could become the first template. Later templates could include:

- board deck,
- sales QBR,
- marketing MOR,
- product launch,
- performance readout,
- executive memo deck.

3. Add direct Google Slides integration

The current approach uses PPTX import. A stronger version could use Google Slides APIs or Apps Script.

4. Add chart generation from spreadsheets

The system could analyze Excel/CSV data and generate:

- funnel charts,
 - KPI scorecards,
 - trend charts,
 - waterfall charts,
 - brand comparison tables.
-

10. Comparison to external tools

Gamma

Gamma is one of the closest commercial analogs. It uses AI to generate presentations, documents, webpages, and visual content from prompts, pasted text, or uploaded files. It also supports editing, collaboration, sharing, and export to other formats. Its strength is that it is polished and productized; its weakness for my use case is that it is less likely to enforce a very specific enterprise workflow like “canonical content plan → WEX skin → PPT cover rule.”

Gemini Gems

Gemini Gems are useful for creating reusable AI assistants with custom instructions and files. They are increasingly integrated into Google Workspace, which makes them attractive for users already working in Docs, Sheets, Slides, Drive, and Gmail. However, my tests showed that Gems may not consistently obey multi-file production rules unless the main instruction is extremely concise and forceful.

Custom GPTs

Custom GPTs are strong for rapid prototyping because they combine instructions, uploaded knowledge, and file-generation tools. They are good for the first version of this project. Their limitations are instruction limits, occasional knowledge retrieval inconsistency, and the need for strong validation when output quality matters.

Claude Skills

Claude Skills appear conceptually closest to the final form of my project because they bundle instructions, scripts, and resources. This matches my need for a reusable workflow with

validation and export logic. The main challenge is access and deployment: my current Claude UI did not expose an obvious custom skill upload path.

Beautiful.ai / Canva / PowerPoint Copilot

These tools focus more on presentation design, template layout, and productivity inside existing presentation ecosystems. They are likely stronger at native slide editing and visual polish, but less customized around my exact methodology unless integrated with a structured content-plan workflow.

11. Recommended next architecture

The strongest version of this project should look like this:

None

1. Source analyzer

Reads PDF/spreadsheet/notes/images.

2. Canonical content planner

Produces structured JSON.

3. Style engine

Applies Executive Premium, WEX, Data Command Center, etc.

4. HTML renderer

Creates interactive browser presentation.

5. PPT renderer

Creates native PPTX from the same content JSON.

6. Validator

Checks blank slides, bad layouts, missing logos, and export issues.

This separates the project into stable layers:

None

content ≠ design ≠ export format

That is the key framework.

12. My personal takeaway

This project started as a desire to create a stylish AI-generated HTML presentation from uploaded content. It became a broader exploration of how to build a reusable AI presentation-production system.

The biggest insight is:

The hard part is not creating slides. The hard part is preserving the same business logic across styles and output formats.

The second biggest insight is:

Brand design must be treated as a skin, not a second content-generation process.

The third biggest insight is:

HTML and PowerPoint need separate renderers from the same content plan.

That framework is what makes the project scalable.

Area	Existing GPT version	Suggested next version	Why it matters
Overall architecture	One large prompt/instruction set plus several Knowledge files.	Modular system: content planning, style selection, HTML generation, PPT export, validation.	Makes the system easier to debug and improve one layer at a time.
Content planning	GPT analyzes source content and directly generates the deck.	GPT first creates a canonical content plan before any design work.	Prevents design style from changing the business story.

Style handling	Styles can accidentally influence story flow, KPI selection, slide count, and recommendations.	Styles are explicitly treated as visual skins only .	Ensures WEX, Executive Premium, and other styles use the same underlying content.
WEX Branded style	WEX sometimes behaves like a separate layout system, causing smaller fonts, condensed layouts, and unused space.	WEX Branded = Executive Premium layout + WEX skin .	Keeps WEX visually branded without hurting readability or layout quality.
Design consistency	Good outputs are possible, but consistency varies by run.	Uses stricter design rules, shared layout patterns, and fixed style definitions.	Produces more predictable slides across repeat runs.
Layout safety	GPT may create narrow text rails, title-only slides, awkward wrapping, or blank areas.	Adds explicit layout safety rules and required content density checks.	Reduces weird slide layouts and prevents unreadable content.
Blank slide prevention	Some versions generated title-only or blank content slides.	Requires every content slide to include visible body content: cards, bullets, KPIs, tables, recommendations, or media.	Prevents “pretty but empty” presentations.
HTML output	Main output is an interactive HTML deck with CSS/JS.	Same, but with stronger HTML structure, reusable classes, and no inline font-size hacks.	Improves design stability and makes the HTML easier to edit.
PowerPoint export	PPT export is treated as a follow-on conversion, but cover slides and HTML effects may break.	PPT is rebuilt from the canonical content plan using PPT-native shapes and rules.	Better PPT quality; avoids broken HTML-to-PPT conversion.
WEX PPT cover	WEX cover may become a content summary slide with KPI cards.	WEX PPT slide 1 is always a branded cover only: no KPIs, tables, charts, or content cards.	Preserves the intended WEX front-page design.

Google Slides support	Indirectly supported through PPT export.	Explicit workflow: create .pptx that can be imported into Google Slides.	Sets correct user expectations.
Validation	Mostly manual review after output.	Add pre-output checks: no blank slides, no title-only slides, no missing WEX logo, no tiny fonts, no PPT cover violations.	Catches common failures before the user sees them.
Brand assets	WEX logo may be approximated with text.	Create a WEX brand asset pack with official logo, colors, approved cover rules, and footer language.	Improves brand fidelity and professionalism.
Prompt complexity	Instructions became long and hard to manage.	Move details into Knowledge files; keep main GPT instruction short and directive.	Avoids instruction limit issues and makes updates easier.
Testing	Testing is ad hoc with real examples.	Create benchmark prompts and sample files to test every version.	Makes improvement measurable instead of subjective.
Scalability	Works as a prototype, but changes can break other parts.	Modular approach supports adding new templates, export types, and validators.	Makes it easier to scale beyond WEX and one-off decks.
Best use case today	Generate good first-draft interactive HTML decks.	Generate reliable, branded, multi-format executive presentations.	Moves from creative prototype to repeatable production workflow.

V2 JSON schema

V1 modularized GPT

Short-term opportunities

1. Create a single stable GPT version

Focus on one reliable implementation first, likely the Custom GPT.

2. Separate the workflow into modules

Use clean modules:

None

content planning

style selection

HTML generation

validation

PPT export

3. Add validation before output

Before returning a deck, check:

- every slide has content,
- no slide overflows,
- logo appears correctly,
- WEX cover is correct,
- PPT slide 1 is not a KPI slide.

4. Create a WEX brand asset pack

Add:

- official logo,
- exact color palette,
- typography guidance,
- approved cover examples,
- approved footer language.

5. Create benchmark prompts

Use a small set of repeatable test files and prompts to evaluate every version.

Python and google scripts

Here is the complete, customized Google Apps Script tailored exactly to your 8 sections and 50 questions. It handles sections, short answers, paragraphs, multiple-choice questions, and checkboxes perfectly.

The Automation Script

```
function createFinancialPlanningForm() {
  // Create the form and set the title/description
  var form = FormApp.create('Financial Planning Intake Questionnaire');
  form.setDescription('Please complete this comprehensive questionnaire to help us build your personalized financial plan. Take your time—your answers will ensure our strategy matches your goals perfectly.');
```

// =====

// SECTION 1: HOUSEHOLD AND TIMELINE

// =====

```
var sec1 = form.addPageBreakItem().setTitle('Section 1: Household and Timeline');
```

```
form.addTextItem().setTitle('1. Primary client name').setRequired(true);
form.addTextItem().setTitle('2. Spouse / partner name').setRequired(false);
form.addTextItem().setTitle('3. Primary client current age').setRequired(true);
form.addTextItem().setTitle('4. Spouse / partner current age').setRequired(false);
form.addTextItem().setTitle('5. Current state of residence').setRequired(true);
form.addParagraphTextItem().setTitle('6. Number of children and their current ages');
form.addParagraphTextItem().setTitle('7. At what age would you like work to become optional for each spouse?');
```

```
form.addMultipleChoiceItem()
  .setTitle('8. Do you expect to move in retirement?')
  .setChoiceValues(['No', 'Move to another U.S. state', 'Move abroad part-time', 'Move abroad full-time', 'Not sure']);
```

```
form.addParagraphTextItem().setTitle('9. If moving is possible, where and when?');
```

// =====

// SECTION 2: RETIREMENT SPENDING AND GOALS

// =====

```
form.addPageBreakItem().setTitle('Section 2: Retirement Spending and Goals');
```

```
form.addTextItem().setTitle('10. Desired annual after-tax spending in retirement, in today's dollars');
```

```
form.addTextItem().setTitle('11. Minimum annual after-tax spending needed to feel secure, in today's dollars');
```

```
form.addCheckboxItem()  
    .setTitle('12. Which major future expenses should be modeled?')  
    .setChoiceValues(['College', 'Weddings', 'Home purchase help for children', 'Second home',  
'Major travel', 'Parent support', 'Healthcare', 'Long-term care', 'Other']);
```

```
form.addParagraphTextItem().setTitle('13. For each major future expense, list estimated amount and expected timing');
```

```
form.addCheckboxItem()  
    .setTitle('14. What are the top priorities for your plan?')  
    .setChoiceValues(['Retirement security', 'Lower lifetime taxes', 'Maximize Roth assets',  
'Preserve ACA subsidies', 'Reduce Medicare IRMAA', 'Fund college', 'Leave inheritance',  
'Charitable giving', 'Flexibility to move abroad', 'Protect surviving spouse', 'Other']);
```

```
// =====
```

```
// SECTION 3: INCOME AND WORK TRANSITION
```

```
// =====
```

```
form.addPageBreakItem().setTitle('Section 3: Income and Work Transition');
```

```
form.addParagraphTextItem().setTitle('15. Current employment status for each spouse');
```

```
form.addParagraphTextItem().setTitle('16. Expected last year of earned income for each spouse');
```

```
form.addParagraphTextItem().setTitle('17. Expected annual earned income for the next 5 years for each spouse');
```

```
form.addMultipleChoiceItem()  
    .setTitle('18. Do you expect bonuses, RSUs, options, deferred compensation, business sale proceeds, or other irregular income?')  
    .setChoiceValues(['Yes', 'No', 'Not sure']);
```

```
form.addParagraphTextItem().setTitle('19. If yes, describe type, timing, and amount');
```

```
// =====
```

```
// SECTION 4: ASSETS BY TAX BUCKET
```

```
// =====
```

```
form.addPageBreakItem().setTitle('Section 4: Assets by Tax Bucket');
```

```
form.addParagraphTextItem()  
    .setTitle('20. Enter approximate current balances by category')  
    .setHelpText('Please include approximate values for:\n- Taxable brokerage\n- Cash / checking / savings / money market\n- Traditional IRA / rollover IRA\n- 401(k) / 403(b) / 457\n-');
```

Roth IRA / Roth 401(k)\n- HSA\n- 529 plans\n- Real estate equity\n- Business equity\n- Trust assets\n- Other');

form.addParagraphTextItem().setTitle('21. Which taxable holdings have large unrealized gains, low basis, or concentration risk?');

form.addMultipleChoiceItem()
.setTitle('22. Do you know the cost basis for your major taxable holdings?')
.setChoiceValues(['Yes', 'No', 'Partially']);

form.addMultipleChoiceItem()
.setTitle('23. Are there any holdings you do not want to sell?')
.setChoiceValues(['Yes', 'No']);

form.addParagraphTextItem().setTitle('24. If yes, list them and explain why');

// =====
// SECTION 5: RETIREMENT INCOME SOURCES
// =====

form.addPageBreakItem().setTitle('Section 5: Retirement Income Sources');

form.addParagraphTextItem().setTitle('25. Expected monthly Social Security benefit for each spouse, in today's dollars');

form.addParagraphTextItem().setTitle('26. Planned claiming age for each spouse');

form.addMultipleChoiceItem()
.setTitle('27. Any expected pension, annuity, rental income, trust income, or business income in retirement?')
.setChoiceValues(['Yes', 'No']);

form.addParagraphTextItem().setTitle('28. If yes, describe source, annual amount, and start year');

// =====
// SECTION 6: TAXES, HEALTHCARE, AND ROTH PLANNING
// =====

form.addPageBreakItem().setTitle('Section 6: Taxes, Healthcare, and Roth Planning');

form.addMultipleChoiceItem()
.setTitle('29. Approximate current federal marginal tax bracket')
.setChoiceValues(['10%', '12%', '22%', '24%', '32%', '35%', '37%', 'Not sure']);

form.addMultipleChoiceItem()
.setTitle('30. Do you usually itemize deductions?')

```

        .setChoiceValues(['Yes', 'No', 'Not sure']);

form.addMultipleChoiceItem()
    .setTitle('31. Do you have capital loss carryforwards or other tax attributes we should know about?')
    .setChoiceValues(['Yes', 'No', 'Not sure']);

form.addParagraphTextItem().setTitle('32. If yes, describe');

form.addCheckboxItem()
    .setTitle('33. How do you expect to get health insurance before age 65?')
    .setChoiceValues(['Employer coverage', 'COBRA', 'ACA Marketplace', 'Private policy', 'International coverage', 'Not sure', 'Other']);

form.addMultipleChoiceItem()
    .setTitle('34. Would you consider structuring income to preserve ACA subsidies?')
    .setChoiceValues(['Yes', 'No', 'Maybe']);

form.addMultipleChoiceItem()
    .setTitle('35. Would you consider living abroad before 65 if it materially reduced healthcare costs?')
    .setChoiceValues(['Yes', 'No', 'Maybe']);

form.addMultipleChoiceItem()
    .setTitle('36. Do you expect medical needs that require U.S.-based coverage or specialist access?')
    .setChoiceValues(['Yes', 'No']);

form.addMultipleChoiceItem()
    .setTitle('37. Are you interested in Roth conversions from pre-tax accounts?')
    .setChoiceValues(['Yes', 'No', 'Not sure']);

form.addTextItem().setTitle('38. If yes, when would you ideally begin Roth conversions?');

form.addMultipleChoiceItem()
    .setTitle('39. Are you willing to use taxable assets to pay tax on Roth conversions?')
    .setChoiceValues(['Yes', 'No', 'Maybe']);

form.addMultipleChoiceItem()
    .setTitle('40. Are you interested in regular Roth contributions or backdoor Roth contributions?')
    .setChoiceValues(['Regular Roth', 'Backdoor Roth', 'Both', 'Neither', 'Not sure']);

// =====

```

```

// SECTION 7: WITHDRAWAL STRATEGY, COLLEGE, AND GIVING
// =====
form.addPageBreakItem().setTitle('Section 7: Withdrawal Strategy, College, and Giving');

form.addCheckboxItem()
    .setTitle('41. Which accounts would you prefer to spend from first in retirement?')
    .setChoiceValues(['Cash', 'Taxable brokerage', 'Traditional IRA', '401(k)', 'Roth accounts',
'HSA', 'No preference', 'Not sure']);

form.addTextItem().setTitle('42. How many years of spending do you want held in cash or
near-cash?');

form.addMultipleChoiceItem()
    .setTitle('43. Do you plan to fully or partially fund college?')
    .setChoiceValues(['Fully', 'Partially', 'Not at all', 'Not sure']);

form.addTextItem().setTitle('44. Expected annual college cost per child, in today's dollars');

form.addMultipleChoiceItem()
    .setTitle('45. Do you currently give to charity or plan large charitable gifts?')
    .setChoiceValues(['Yes', 'No', 'Maybe']);

form.addMultipleChoiceItem()
    .setTitle('46. Would you consider donating appreciated securities or using a donor advised
fund?')
    .setChoiceValues(['Yes', 'No', 'Maybe']);

// =====
// SECTION 8: ESTATE AND SCENARIO PREFERENCES
// =====
form.addPageBreakItem().setTitle('Section 8: Estate and Scenario Preferences');

form.addMultipleChoiceItem()
    .setTitle('47. Do you have up-to-date wills, trusts, and beneficiary designations?')
    .setChoiceValues(['Yes', 'No', 'Not sure']);

form.addCheckboxItem()
    .setTitle('48. Which scenarios would you like modeled?')
    .setChoiceValues(['Base case', 'Early retirement', 'Delayed retirement', 'Lower returns',
'Higher inflation', 'One spouse dies early', 'Move to lower-tax state', 'Move abroad', 'Max Roth
conversion', 'Preserve ACA subsidies', 'Maximize legacy', 'Other']);

form.addParagraphTextItem().setTitle('49. What is the biggest financial risk you want us to
protect against?');

```

```
form.addParagraphTextItem().setTitle('50. What is the biggest planning opportunity you want us to pursue?');
```

```
// Print links to the console
Logger.log('Form Live Link (For Clients): ' + form.getPublishedUrl());
Logger.log('Form Edit Link (For You): ' + form.getEditUrl());
}
```

Googlesheet content copy

Copy content from one googlesheet to another automatically

Colab is great for testing, but regular consumer Colab is not the most reliable scheduler. Google does support scheduled notebook runs in **Colab Enterprise**, and older Colab Pro+ workflows had scheduled notebooks, but for a simple Google Sheet-to-Google Sheet copy, Apps Script is cleaner because it runs inside Google Workspace and has built-in time-driven triggers. Google's Apps Script installable triggers can run functions automatically on a schedule.

Best option: use Google Apps Script schedule

Open your **destination Google Sheet**, then go to:

Extensions → **Apps Script**

Paste this script:

None

```
function copySourceToDestination() {
  const sourceSpreadsheetId = "1-wChQp6H5lq2wz8gluW-5oyuMudWLvWJ";
  const destinationSpreadsheetId =
    "1CslxqqcScr0fEq22UvS5zgQTtK9ffV_yz-n8VffvwJk";

  const sourceTabName = "2026 Global Mktg Scorecard";
  const destinationTabName = "2026";

  const sourceSS = SpreadsheetApp.openById(sourceSpreadsheetId);
  const destinationSS =
    SpreadsheetApp.openById(destinationSpreadsheetId);

  const sourceSheet = sourceSS.getSheetByName(sourceTabName);
  const destinationSheet =
    destinationSS.getSheetByName(destinationTabName);

  if (!sourceSheet) {
    throw new Error("Source tab not found: " + sourceTabName);
  }

  if (!destinationSheet) {
```

```

        throw new Error("Destination tab not found: " +
destinationTabName);
    }

    const values = sourceSheet.getDataRange().getValues();

    destinationSheet.clearContents();

    if (values.length > 0 && values[0].length > 0) {
        destinationSheet
            .getRange(1, 1, values.length, values[0].length)
            .setValues(values);
    }
}

```

Then run it once manually by clicking **Run**. Google will ask you to authorize it.

Add the schedule

In Apps Script:

1. Click the **Triggers** icon on the left sidebar. It looks like a clock.
2. Click **Add Trigger**.
3. Choose function: `copySourceToDestination`
4. Event source: **Time-driven**
5. Choose your schedule, for example hourly, daily, weekly, etc.
6. Save.

That will run automatically.

If you want to keep using Python

You can schedule Python through GitHub Actions, Google Cloud Scheduler, or Colab Enterprise. For this particular job, that is more setup than you need. Apps Script is simpler because it already has access to Google Sheets and native time-driven triggers.

Google form automation

Opportunity scanner

<https://chatgpt.com/g/g-6a0f49b0d6d081918f5bab7adf44a681-high-growth-investment-research-gpt>

Methodology

1. Start with a “where will growth happen?” thesis

Top investors usually do **not** start by asking, “What stock should I buy?” They start with:

“Which markets are going to grow much faster than GDP over the next 5–10 years, and which companies are positioned to capture that growth?”

Examples of thesis areas today include AI infrastructure, vertical AI, cybersecurity, cloud automation, energy transition, fintech infrastructure, healthcare automation, defense tech, robotics, and data infrastructure.

VC firms such as Bessemer publish market-focused benchmarks like the Cloud 100, which tracks leading private cloud, SaaS, and AI companies. Bessemer’s 2025 report noted that the Cloud 100 cohort exceeded \$1 trillion in total value, with AI talent and growth driving valuations. Sequoia has also recently argued that a major next wave may come from AI companies that “sell outcomes,” not just software tools, especially in service-heavy industries.

Your GPT should first identify high-growth market themes before looking for companies.

2. Build a market map

Professional investors map an industry before choosing winners. A good market map includes:

Layer	What investors ask
Market size	Is this a \$10B, \$100B, or \$1T opportunity?
Growth rate	Is the category growing 15%, 30%, 50%+ annually?
Value chain	Where does profit concentrate? Infrastructure, apps, distribution, data, payments, services?
Competitive structure	Fragmented market or winner-take-most?
Adoption drivers	Why now? Regulation, technology shift, cost pressure, consumer behavior, AI capability?
Incumbents	Are large players vulnerable or likely acquirers?

Private-company activity	Which startups are raising large rounds? Who is backing them?
Public comps	Which listed companies represent the category? Are they overvalued or temporarily cheap?

For example, in cloud and AI, investors often look at ARR growth, retention, gross margin, CAC payback, and Rule of 40-style efficiency metrics. Bessemer's Cloud 100 work is useful because it benchmarks private cloud leaders and shows which business models attract premium valuations.

3. Source companies from multiple signals

VC, PE, hedge funds, and growth-equity firms use different sources, but the logic is similar: find **early evidence of momentum before consensus forms**.

Common sourcing signals

Signal	Why it matters
Funding rounds	Strong investors backing the company may indicate institutional conviction.
Revenue growth	The best private companies often grow ARR/revenue extremely fast.
Customer adoption	Enterprise logos, usage growth, app rankings, developer adoption, reviews.
Hiring velocity	Rapid hiring in sales, engineering, product, or international markets can signal expansion.
Founder quality	Prior exits, technical depth, domain expertise, recruiting ability.
Strategic investors	Investments by Microsoft, Nvidia, Salesforce, Amazon, Google, Visa, Mastercard, JPMorgan, etc. can signal ecosystem importance.
Partnerships	Cloud marketplace listings, hyperscaler partnerships, channel agreements.

Patent/product velocity	Especially relevant for AI, biotech, semiconductors, robotics, energy, and hardware.
Web/app/developer traction	Website traffic, GitHub activity, API usage, community growth, product reviews.
M&A interest	If incumbents are buying similar companies, the category may be heating up.

PitchBook markets its VC data around exactly these needs: financing rounds, pre-money valuations, fundraising, fund performance, and deal sourcing.

4. Apply a professional screening framework

A useful high-growth company screen should separate **great company**, **great investment**, and **good timing**. They are not the same thing.

A. Market attractiveness

Ask:

- Is the company in a market with structural growth?
- Is the market large enough to support a \$10B+ company?
- Is there a “why now” catalyst?
- Is the market expanding, or is the company only taking share in a slow-growth market?

Score: **1–5**

B. Company quality

Ask:

- Is revenue growing fast?
- Does the company have strong gross margins?
- Are customers staying and expanding?
- Is the product mission-critical?
- Does the company have pricing power?
- Is there evidence of network effects, data advantage, switching costs, or brand strength?

For SaaS/cloud companies, investors often look at metrics like ARR growth, net revenue retention, CAC payback, gross margin, and Rule of 40. Bessemer's public and private cloud analysis is often used as a reference point for those kinds of benchmarks.

Score: **1–5**

C. Management/founder quality

Ask:

- Has the founder built or scaled before?
- Can they attract talent?
- Do customers trust them?
- Do top-tier investors keep reinvesting?
- Do they have a sharp wedge into a large market?
- Are they visionary but financially disciplined?

VC due diligence typically includes evaluating the business model, financial health, market position, product viability, customer base, management team, and operating structure.

Score: **1–5**

D. Competitive advantage

Ask:

- What prevents a larger company from copying this?
- Does the company own unique data, workflow, distribution, infrastructure, or customer relationships?
- Is the company becoming the system of record?
- Does the product get better with usage?
- Is there regulatory, technical, or ecosystem complexity that creates a moat?

Score: **1–5**

E. Financial quality

For public companies:

- Revenue growth

- Gross margin
- Operating margin trend
- Free cash flow
- Balance sheet strength
- Dilution
- Valuation multiple versus growth
- Earnings revision trend

For private companies:

- ARR/revenue growth
- Burn multiple
- Runway
- Gross margin
- Net revenue retention
- Customer concentration
- Latest valuation
- Quality of investors
- Likelihood of IPO or acquisition

Score: **1–5**

F. Valuation and timing

This is the part many retail investors skip.

A great company can still be a bad investment if the entry price is too high. Professionals ask:

- Is the valuation already pricing in perfection?
- Has the stock fallen because of temporary fear or permanent impairment?
- Are estimates too low or too high?
- Is there a catalyst in the next 6–24 months?
- Is the company misunderstood by the market?
- Is sentiment washed out?
- Are insiders buying?
- Are top institutions accumulating?

For PE, valuation discipline and active value creation are central. McKinsey describes PE investing as spanning deal decision-making, active portfolio management, and value creation across the deal life cycle.

Score: **1–5**

5. Use different workflows for public vs. private companies

For public companies

Top hedge funds and asset managers often look for:

1. **High-growth category**
2. **Company gaining share**
3. **Temporary stock weakness**
4. **Strong unit economics**
5. **Upcoming catalyst**
6. **Valuation below future potential**

They may buy when:

- The company missed earnings for temporary reasons
- The whole sector sold off
- Interest rates pressured growth stocks
- The company is investing heavily and depressing margins
- The market does not yet understand a new product cycle
- The company is transitioning business models

The goal is to find a company where the market is focused on short-term noise, while long-term fundamentals are improving.

For private companies

VC and growth-equity investors look for:

1. **Explosive market**
2. **Exceptional founder**
3. **Early product-market fit**
4. **Fast revenue/user growth**
5. **High-quality customers**
6. **Strong investors already involved**
7. **Potential IPO or acquisition path**

You, as an individual investor, may not be able to invest directly in many private companies, but you can still benefit by tracking:

- Public companies that invest in them
- Strategic partners

- Potential acquirers
- Venture funds or listed investment vehicles
- Suppliers/enablers of that company's growth
- Future IPO candidates

Example: a private cybersecurity company with investment from Bessemer, Salesforce Ventures, and strategic partnerships with Nvidia, Microsoft Azure, and AWS may be worth watching not only as a future IPO candidate, but also as a signal about where cloud security spending is going.

6. Professional diligence checklist

Before investing, professionals usually diligence across six areas:

1. Market diligence

- Market size
- Growth rate
- Customer pain
- Budget availability
- Regulatory tailwinds/headwinds
- Competitive landscape

2. Product diligence

- Product differentiation
- Customer reviews
- Usage intensity
- Integration depth
- Switching costs
- Product roadmap

3. Customer diligence

- Who buys it?
- Why do they buy?
- How painful is the problem?
- Is it mission-critical?
- Are customers expanding usage?
- Is churn low?

4. Financial diligence

- Revenue growth
- Gross margin
- Cash burn
- Profitability path
- Valuation
- Debt
- Dilution risk

5. Management diligence

- Founder track record
- Executive team
- Hiring quality
- Insider ownership
- Strategic clarity
- Capital allocation

6. Exit / return diligence

- IPO potential
- Acquisition potential
- Long-term compounder potential
- Expected return under bull/base/bear cases
- Downside risk

7. A practical scoring model for your future GPT

You can score companies on a 100-point system:

Category	Weight
Market growth and size	20
Company growth and traction	20
Competitive advantage	15
Management/founder quality	15
Financial quality	10
Valuation attractiveness	10

Catalysts/timing	5
Risk level	5

Then classify:

Score	Interpretation
85–100	High-priority watchlist / deep diligence
70–84	Attractive but needs more evidence
55–69	Interesting but speculative
Below 55	Avoid unless facts change

For public stocks, the GPT should also ask: **“Is the stock price low because the market is wrong, or because the business is deteriorating?”**

That is one of the most important questions.

8. The “professional investor” workflow

Here is the full workflow I would recommend for your GPT:

Step 1: Identify growth themes

Find sectors with strong 5–10 year tailwinds.

Step 2: Build market map

List public leaders, private leaders, emerging startups, incumbents, and strategic investors.

Step 3: Create company universe

Include public companies, private companies, recent IPO candidates, and companies backed by top VC/PE/strategic investors.

Step 4: Screen for momentum

Look for revenue growth, funding, hiring, customer wins, product launches, partnerships, and market share gains.

Step 5: Score company quality

Use market, product, financial, management, and moat criteria.

Step 6: Analyze valuation

For public companies, compare growth-adjusted valuation to peers. For private companies, compare latest valuation to revenue scale, funding quality, and exit potential.

Step 7: Identify timing opportunity

Look for dislocations: market selloff, misunderstood earnings, temporary margin compression, pre-IPO window, or strategic investment signal.

Step 8: Build watchlist

Rank companies into:

- Buy now / research deeply
- Watch for pullback
- Watch for IPO
- Watch strategic investors
- Avoid

Step 9: Monitor catalysts

Track earnings, funding rounds, product launches, customer wins, regulation, insider buying, analyst revisions, and M&A.

Step 10: Reassess quarterly

Update the thesis. If the facts change, change the rating.

9. What your custom GPT should eventually do

Based on what you said, your GPT should be able to produce outputs like:

- **High-growth market scan**
- **Emerging company watchlist**
- **Public stock pullback opportunity analysis**
- **Private company / pre-IPO tracker**
- **VC-backed company analysis**

- **Strategic investor signal analysis**
- **Market map**
- **Company scorecard**
- **Bull/base/bear investment thesis**
- **Catalyst calendar**
- **Risk assessment**
- **“Why is the stock down?” analysis**
- **“Is this company investable now?” recommendation framework**

The most important rule: it should separate **company quality** from **entry price**. The best investors want both: a great company and a favorable entry point.

GPT	Main job	Output
Trend Scout GPT	Scan news, blogs, Reddit, social media, VC reports, earnings calls	Ranked trend themes
Market Map GPT	Convert a trend into a market structure	Market map + value chain
Company Discovery GPT	Identify public/private companies in the market	Company universe
Diligence GPT	Analyze one company deeply	Investment memo
Valuation GPT	Compare public stock valuation and entry timing	Valuation/timing score
Watchlist GPT	Track catalysts and changes	Weekly/monthly update

Phase 1: One GPT, many modes

Create one GPT called something like:

High-Growth Investment Research GPT

Its job:

Identify emerging growth themes, map markets, discover public/private companies, evaluate investment quality, track valuation/timing, and maintain a watchlist.

This GPT should be able to produce different outputs depending on the question.

Phase 2: Add handoff packets

Even inside one GPT, require every output to end with:

None

NEXT STEP HANDOFF

Current stage:

Key findings:

Best opportunities:

Open questions:

Recommended next analysis:

Inputs needed:

This prepares you to split the system later.

Phase 3: Split into specialist GPTs only after patterns stabilize

Once you know your favorite workflows, split into:

1. **Trend Scout GPT**
2. **Market Map GPT**
3. **Company Diligence GPT**
4. **Valuation & Timing GPT**
5. **Watchlist Monitor GPT**

1. Trend Scout

↓

2. Market Map

↓

3. Company Universe Builder

↓

4. Company Scorecard

↓

5. Deep Diligence

↓

6. Valuation & Entry Timing

↓

7. Watchlist / Catalyst Tracker

↓

8. Monthly Reassessment

Recommended Investment Research Workflow

Relative importance of each stage in finding high-growth companies with attractive entry points.

What each stage should answer

1. Trend Scout

Question:

“Where will growth happen?”

Sources:

- News
- VC blogs
- earnings calls
- Reddit
- trade publications
- funding announcements
- job postings
- app/product reviews
- analyst reports
- public-company commentary

Output:

None

Top emerging themes:

1. Theme
2. Why now
3. Evidence
4. Companies mentioned
5. Confidence score
6. Next research step

2. Market Map

Question:

“How is this market structured?”

Output:

None

Market:

Value chain:

Customer segments:

Incumbents:

Startups:

Public companies:

Private companies:

Strategic investors:

Profit pools:
